

## **Secondary Mill Residue & Urban Wood Waste Quantities in the United States**

**December 1999**

This report provides information on the types and amounts of wood available for fuel (and other uses). This study focuses on secondary mill residues and urban wood wastes, and estimates quantities and prices based on seven national wood waste assessments completed by others. The goal of the study is to build overall confidence in estimates of secondary mill residues and urban wood waste quantities and prices. This is achieved by obtaining a clear understanding of existing data on wood residues and wastes, identifying residues or wastes for which data is not available, and analyzing and compiling the data into a defensible estimate of quantities and prices. Overall, the results of the analysis indicate that a tremendous amount of secondary mill residues and urban wood wastes are generated in the U.S., and that a large fraction of that amount is potentially available for fuel.
